BRAVE NEW FILMS

**LOS ANGELES
SMOG, 1954**

**LOS ANGELES
TODAY**

**THANKS TO
ENVIRONMENTAL
REGULATIONS**

The emissions that affect air quality, impact climate. What are the lessons learned?

Remembering

Birmingham, AL: bastion of social change in the U.S.

The Birmingham News file/Dave Battle

EPA's first implementation of the CAA's
"emergency powers" provision.

40 years later EPA
proposed Birmingham be certified as
having attaining National Ambient Air
Quality Standards (NAAQS)

US Air Pollution Regulation

Clean Air Act (CAA) of 1963*

Motor Vehicle Air Pollution Control Act of 1965

Air Quality Act of 1967

Clean Air Amendments of 1970* Creation of EPA

CAA Amendments of 1977

CAA Amendments of 1990

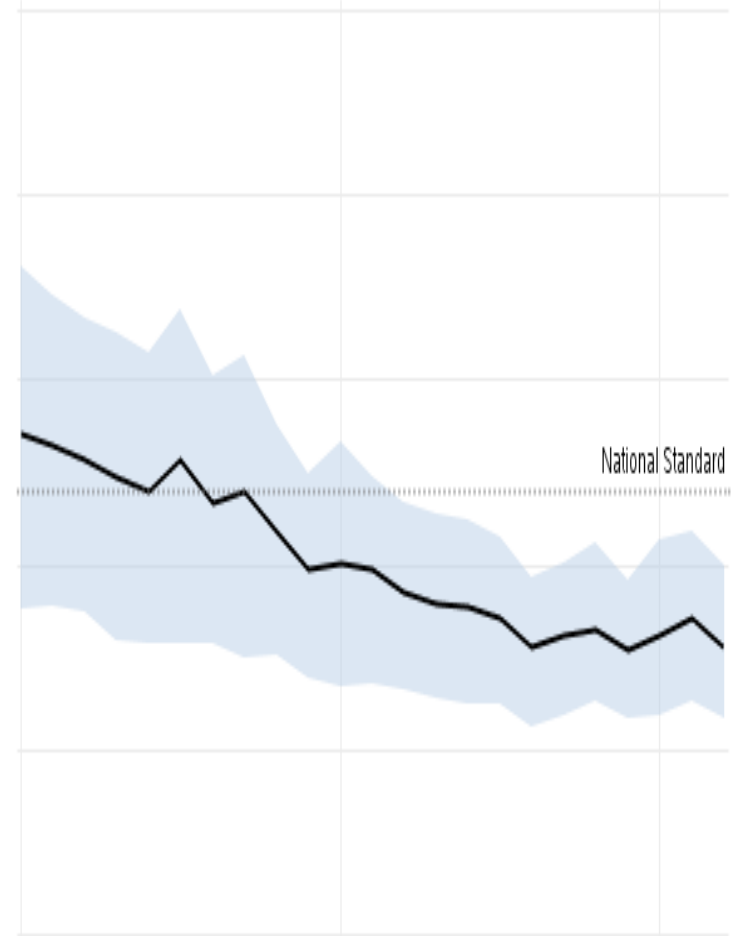

Inflation Reduction Act 2023:
CO₂ is a CAA pollutant

EPA promulgates standards that define what CAA/CAAA means

"Command & Control" or "Performance Standards"

"Cap & Trade" or Pollutant Trading

Airshed approach: "criteria" air pollutants

Criteria Pollutants

Carbon Monoxide

Lead

Sulfur Dioxide

Nitrogen Dioxide

Ground-level ozone

Particulate matter

Criteria Pollutants

Carbon Monoxide

Lead

Sulfur Dioxide

Nitrogen Dioxide

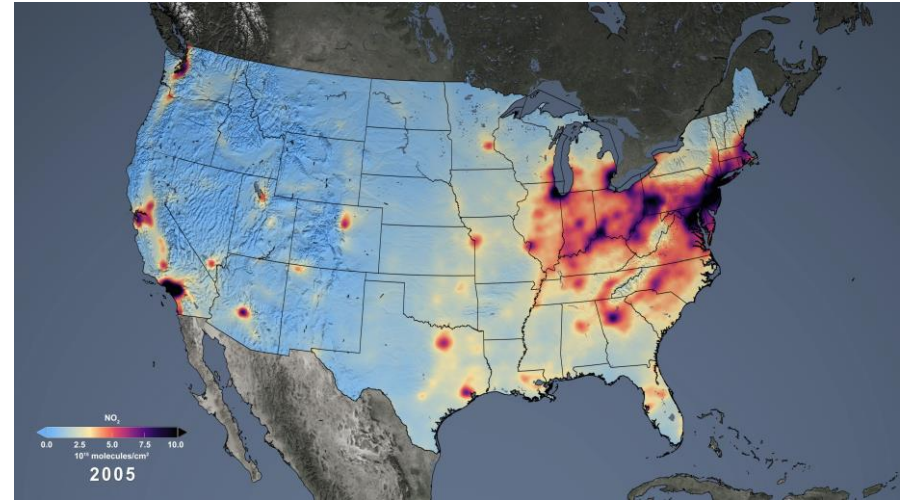

directly emitted

Ground-level ozone

Particulate matter

forms in atmosphere
from precursors

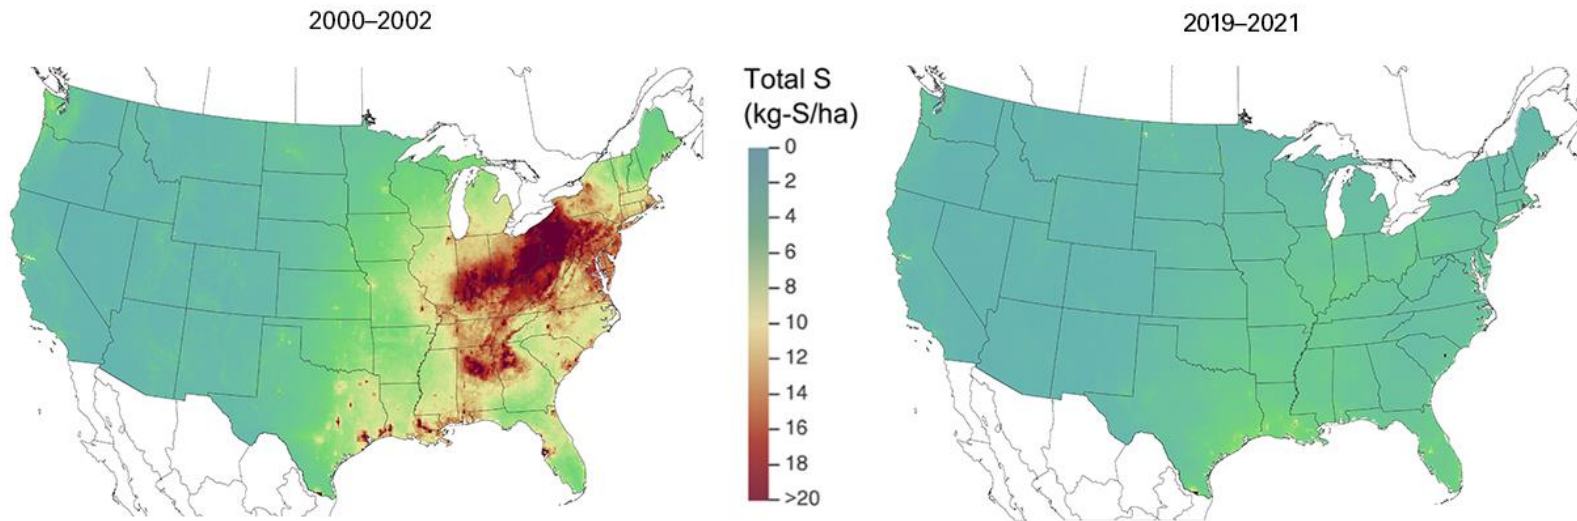

State Autonomy: meet airshed values, when in "non-attainment" States prepare State Implementation Plans (SIPs) demonstrating how they will attain the standard

NASA detects reduction in NO₂ burden with
remarkable fidelity

Acid Rain Rules

Three-Year Average of Total Sulfur Deposition

Source: CASTNET/CMAQ/NADP
USEPA, 2022

Europe largely employed **traditional performance standards** and saw **larger reductions more quickly**

Performance Standards & Air Shed Approaches

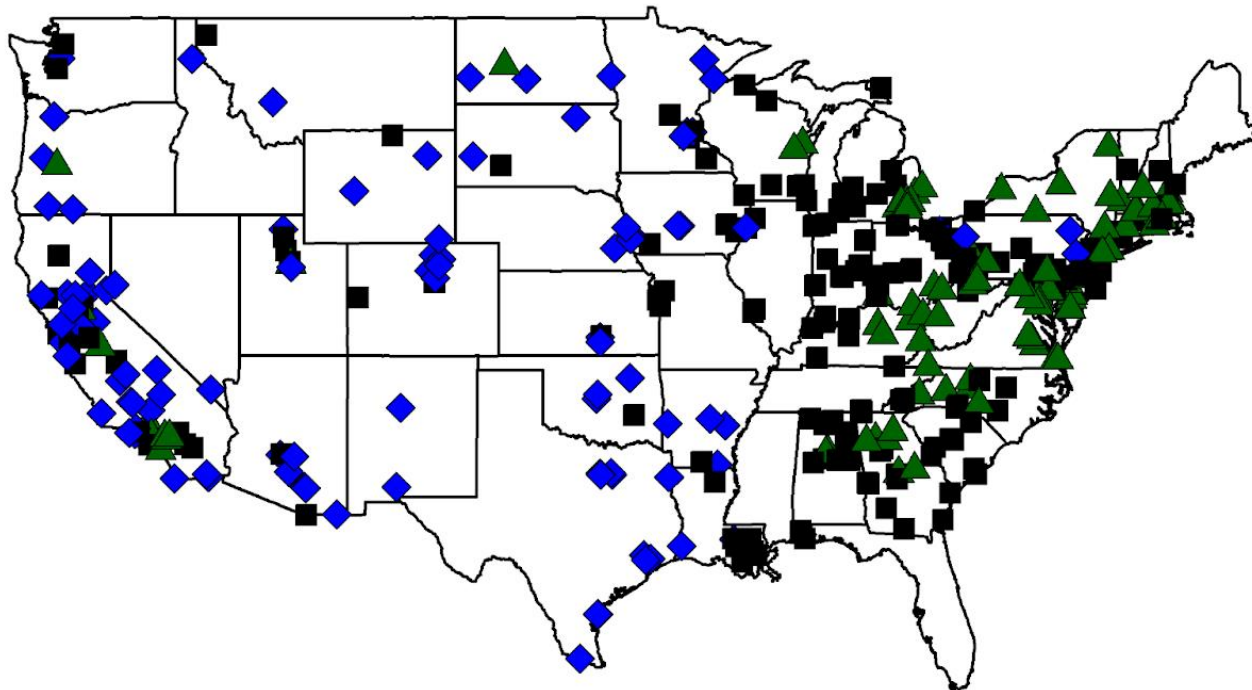

PM2.5 Air Quality, 2000 - 2022
(Seasonally-Weighted Annual Average)
National Trend based on 361 Sites

2000 to 2022 : 42% decrease in National Average

<https://www.epa.gov/air-trends/particulate-matter-pm25-trends>

PM_{2.5} 2002-2017

EPA air pollution policy: tremendous success reducing emissions from point sources and motor vehicles

The land sector is traditionally more difficult for EPA

Regulatory $PM_{2.5}$ monitors: accurately describe atmospheric burden?

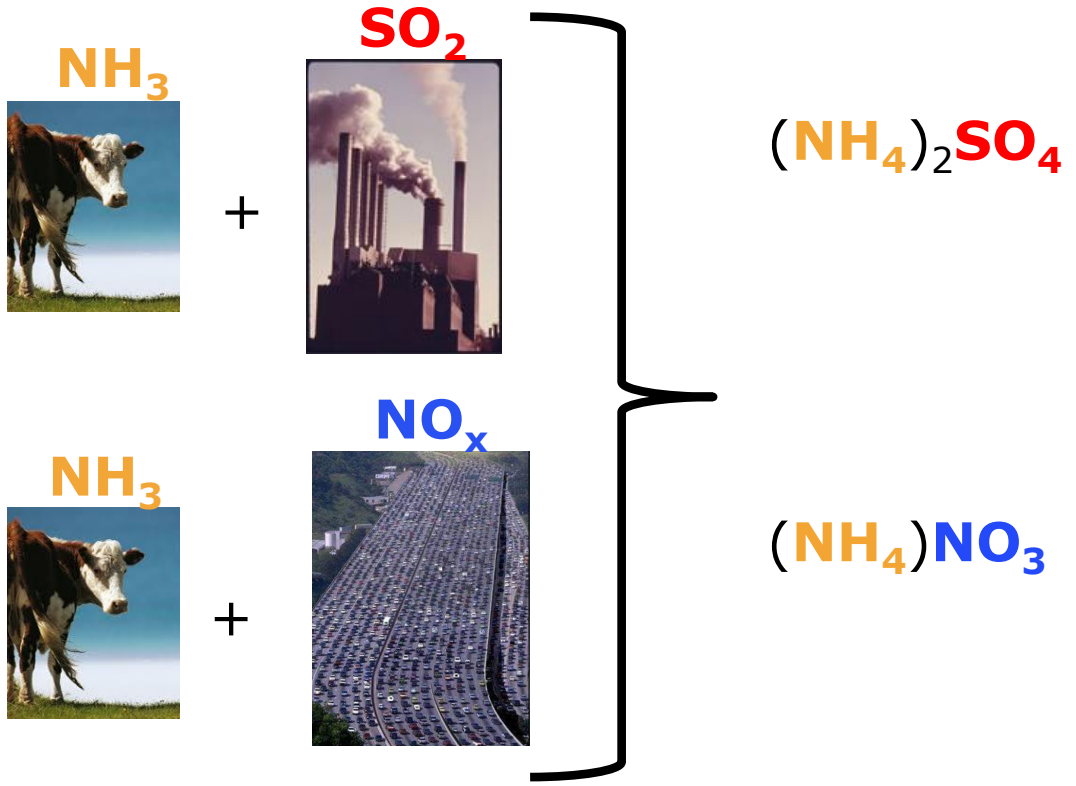

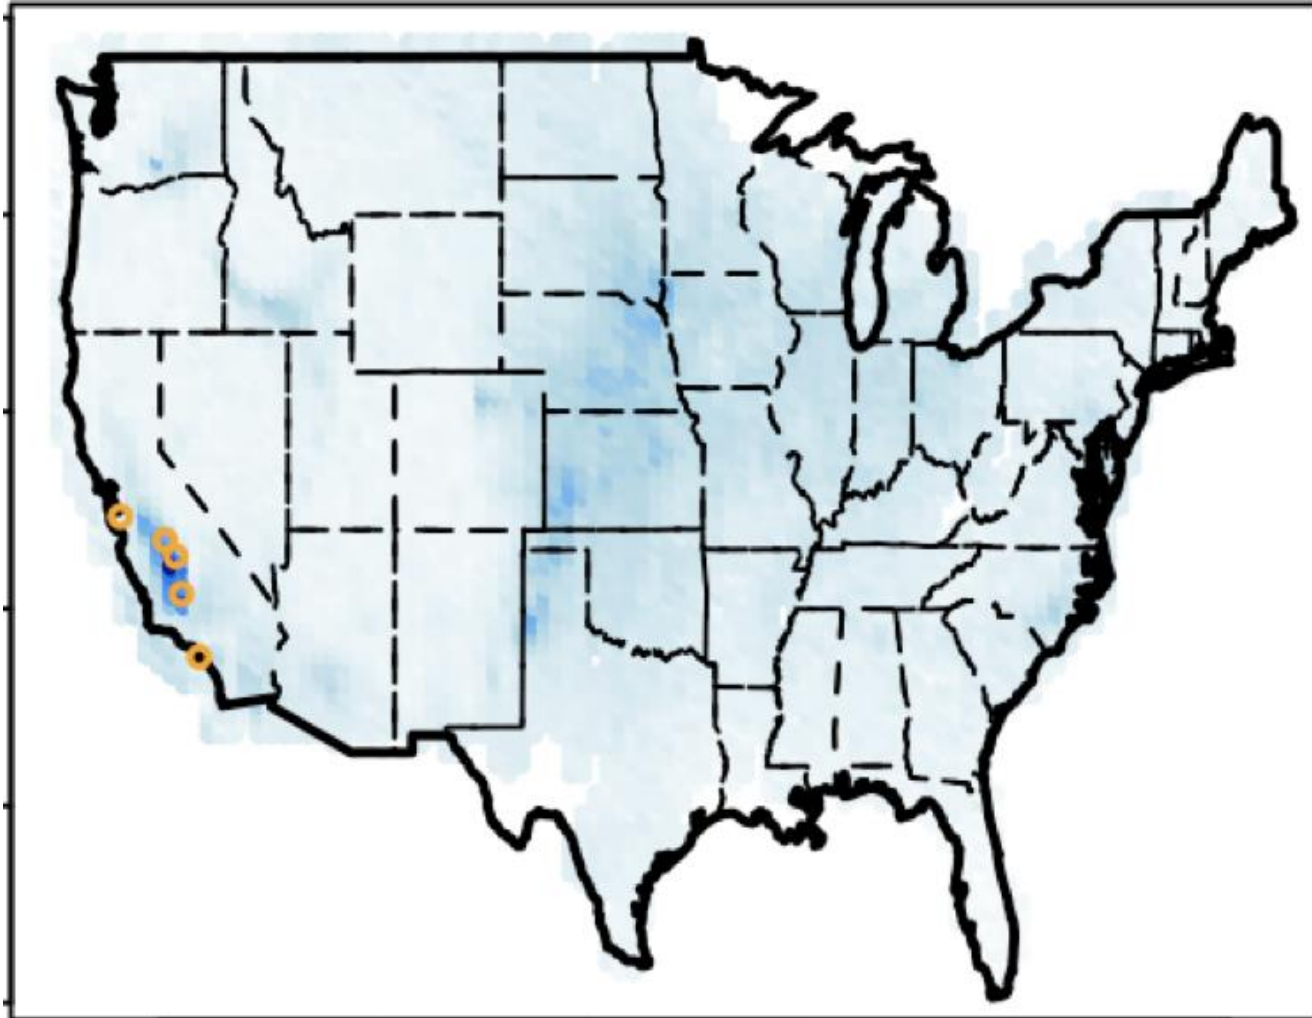

Sulfate
Nitrate
Organic carbon
Black carbon

PM_{2.5} is salty

chemistry

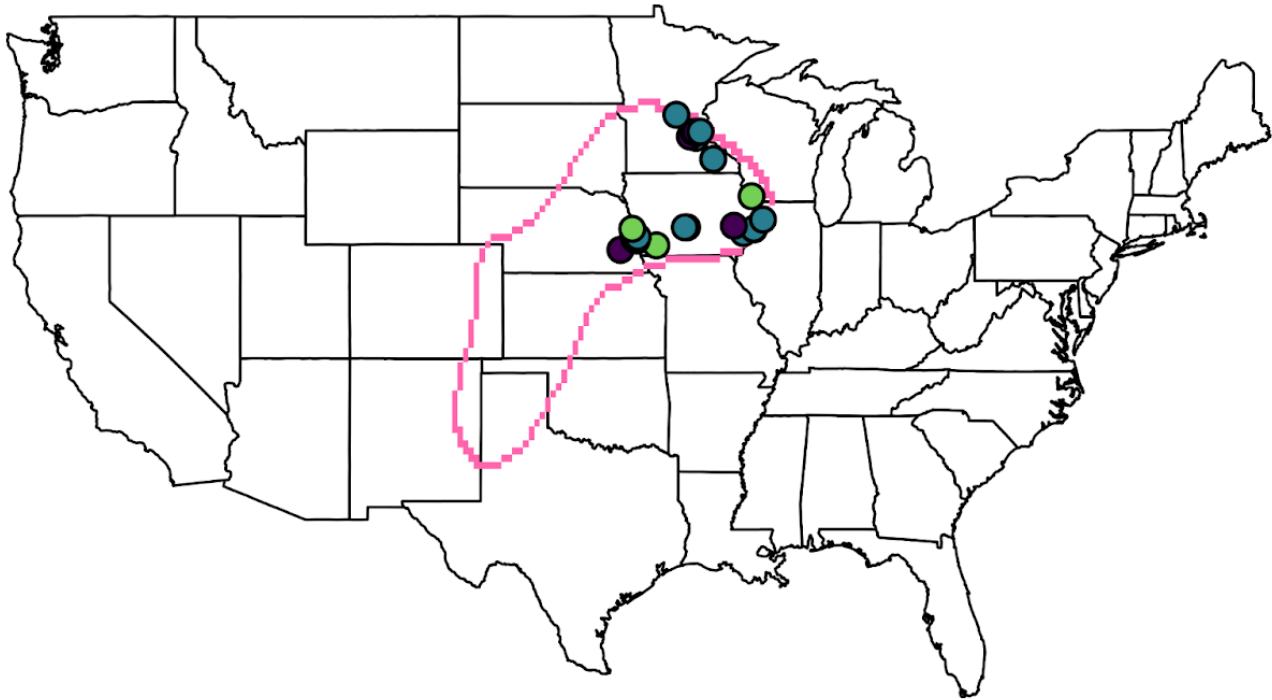

○ most polluted cities for year-round PM_{2.5}

Change in ammonia from 2002-2017

Independent patterns for animals & ammonia are remarkably similar

● RURAL ● SUBURBAN ● URBAN AND CENTER CITY

Agriculture is the largest source of several air pollutants that degrade air quality & contribute to the climate crisis

Ag emissions are poorly quantified & largely unregulated.

THERE IS LITTLE
PUBLIC DATA

Hurdles are largely social & political, not scientific & technological

2020 U.S. Methane Emissions, By Source

The emissions that adversely impact air quality also affect climate. Air Quality is vastly improved. What are the lessons learned?

Rural air quality is not as routinely measured relative to urban population centers. To what extent does this hinder accurate quantitative understanding of current conditions and trends?

21st century science and technology makes it harder for pollution to hide. What role should new tech play in regulatory policy?

CONCAWE organizers

Federal level funding for sciences safeguards human health and environment: NSF, NASA, NOAA, EPA, DoD, WHOSTP

At federal, state and local levels: technicians, program managers, data managers, etc.

Alyssa Burns, Gabe Chandler, Kira Dunham

EXTRA SLIDES

2017

Sector

- Agriculture - Fertilizer Application
- Agriculture - Livestock Waste
- Fires
- Fuel Combustion
- Industrial/Solvent
- Mobile/Transportation
- Other

EPA's National Emissions Inventory: NH_3 from livestock 3x all other sources combined, including fertilizer

*estimated from activity data and feed look up tables

animal unit density at CAFOs

USDA Census of Agriculture:
available every 5 years from
1997-2017, **largest CAFOs
missing**

Under EPA's NPDES program,
some states report raw
numbers of CAFOs

Both data sets are incomplete

animal unit numbers
not increasing,
animal density is
increasing

policy & regulations for agriculture

EPA regulates NH_3 under CERCLA & EPCRA *except* when on farm

2006: EPA "Final Order" CAFO that paid a nominal penalty to fund a 2-year study to establish Emissions Estimating Methodologies (EEMs) protected from penalty

EEMs not finalized & Order still in effect; IG urged EPA to end the Order

2008: GAO urged better data for EPA to regulate CAFOs

NEPA exempts agriculture and CAFOs from some requirements, also Agency categorical exemptions. **2018:** FARM Act exempts farms from any self-reporting requirements for animal waste

2021, 2022, ... riders in Appropriations Act prohibit use of funds to issue air permits or require GHG reporting from animal manure management

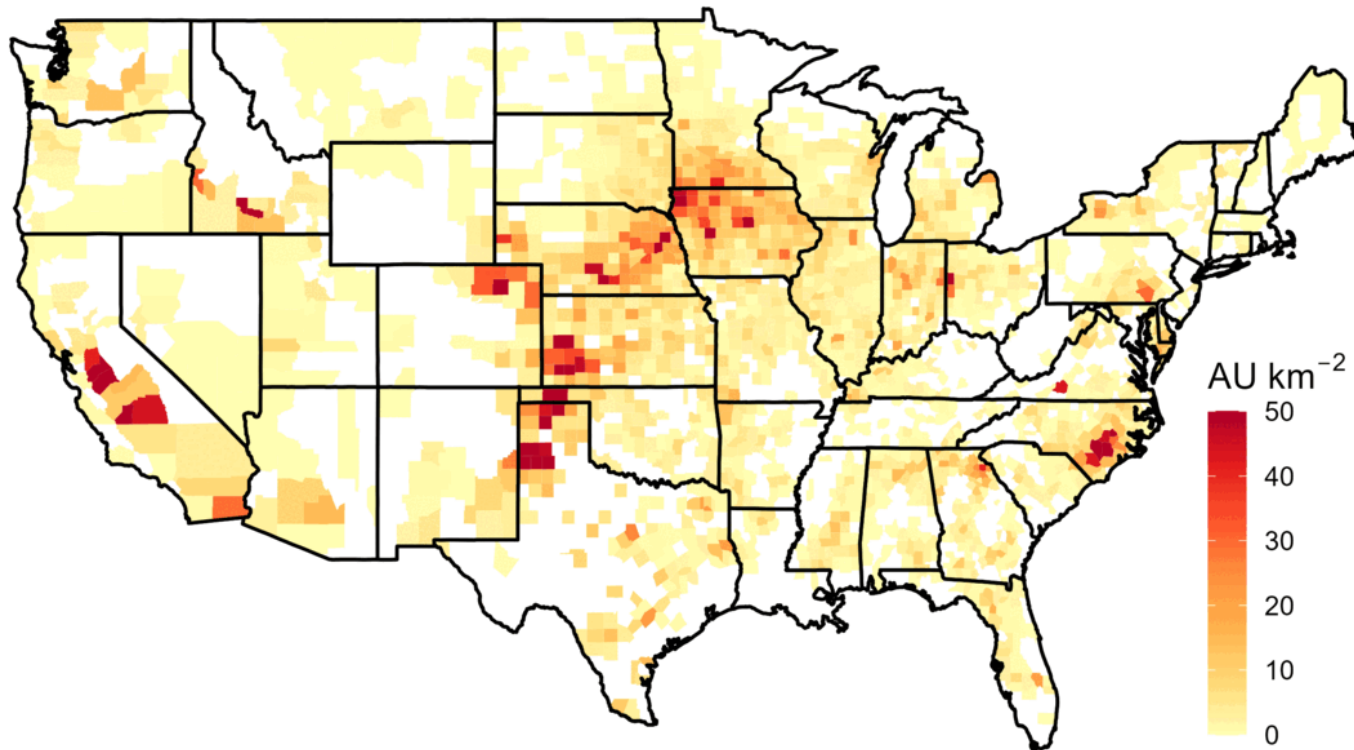

farm workers during Covid & epic wildfire

The most ambitious climate plans to decarbonize 'everything' will improve AQ in cities. What about agricultural regions?

Migrant, seasonal workers are among the most vulnerable in the US & globally

2002

animal unit is roughly 1000lb of live weight: individual cattle or cow, 2.5 hogs, and 125 chickens.
